

This project was supported by AI at level 2 (shaping) according to AI and Academic Integrity guidelines

AI tools used: Copilot.

Things that helped shaping the project:

- Clarifying complex concepts such as the mathematics behind YOLO bounding box conversion, image projection, and coordinate transformation.
- Debugging tool to read and analyse the “mathematically complicated output”.
- Explaining code errors.
- Understanding the environment in Webots like (objects mass and floor friction, how PROTO files works).
- Assisted in integrating Yolo trained model inside Webots.

Overall, AI was used mainly as a tutor along this project, it did not used to generate code or results. However, all core development, coding, decision-making, experimentation, and implementation were performed by me.
